SUMMARY

Analytical, execution-oriented operator with hands-on experience across digital asset research, market structure analysis, and independent portfolio management. Comfortable working in ambiguous, early-stage environments and supporting founders with research, documentation, and operational execution. Strong written communication, high attention to detail, and a disciplined, low-ego approach to building systems from the ground up.

EXPERIENCE

Quantitative Research & Market Analysis

Independent

- 06/2018 - Present Waterloo, Belgium
- Built daily Python workflows to scrape, parse, and normalize data from **open-source APIs** (CMC, QuantKiosk and PolygonAI).
 - Performed data wrangling and feature extraction to transform noisy raw data into structured datasets suitable for analysis and backtesting using R.
 - Generated actionable quantitative research by identifying statistical behaviors such as mean reversion, trend continuation, volatility compression/expansion, and liquidity shifts.
 - Developed rule-based trade strategy frameworks (entry, sizing, invalidation) driven by data outputs rather than discretionary opinion.
 - Maintained organized research notebooks, versioned scripts, and written summaries documenting hypotheses, assumptions, and results.

Bitcoin Futures Research & Execution

Independent

- 03/2015 - 05/2018 Waterloo, Belgium
- Began in spot crypto markets, focusing on capital preservation, market structure, and narrative-driven liquidity cycles.
 - Started gathering data on financial markets, using the demo trading as a real-time laboratory to understand market microstructure, leverage dynamics, funding behavior, and liquidation mechanics.
 - Transitioned to manual Bitcoin perpetual futures trading, using isolated margin to study leverage dynamics, funding-rate behavior, liquidation cascades, and intraday volatility regimes in live conditions.
 - Progressed into systematic quantitative research, replacing discretionary entries with explicit, testable rules driven by price, volume, time-of-day, and volatility constraints.
 - Applied Python-based scripts to study price-volume relationships, funding rate extremes, and volatility regimes, feeding insights back into risk management frameworks.
 - Focused on process learning and risk awareness, treating early execution as a data-gathering phase rather than pure PnL maximization.

EDUCATION

Undergrad Data analytics

Western Governors University

12/2025 - 12/2028 Bruxelles, Belgium

LANGUAGES

KEY ACHIEVEMENTS

- Growth Champion**
Multiple entries in the top3 traders on Mexc in August 2024. Successfully grew my futures account from 26k to 304k during my first year of trading achieving a sharpe ration of 3+. And a maximum drawdown of 10% on leverage trades.
- Certifications**
Successfully passed the CISSP certification exam
CCNP ENSLD 350-401
Comptia Security + SY0 601
